

Treyos API

Official Documentation for Treyos App

NOTE

- Check for all sample response for every given endpoint

VERSIONING

Because we aren't versioning the API in the URI we need to define an Accept header to request a specific version. The header is formatted like so.

```
Accept: application/vnd.treyos.v1+json
```

i.e All request made for v1 of this app will be made alongside the above header

In a case were the header above is not passed, then the app uses v1 by default

TEST BASE URL

```
https://staging-api.treyos.com/api/
```

POST

Register

[Open Request](#)

{{baseUrl}}/account/register

Register

This endpoint is used to register a new sub-contractor or driver.

For every part you see the work 'user', know what i am talking about sub-contrator or driver

A verification code is sent to the user phone number immediately after registration.

Use the "Verify Account" endpoint to verify the registered sub-contractor or driver.

At the moment, the verification code is added to the success register response as

"auth_code": 6768 just for the purpose of test, I will setup sms service provider for sending sms later.

You are expected to save the data returned somewhere as the email will be required for the next screen when user didn't get verification at once.

Take note of the `"phone_number_verified_at": null` key as null value signifies a user is not verified and is required to go to the verification page else a date is returned as the value, this is not significant here, but it is when user wants to login.

User did not get the verification code

Use the "Resend Account Verification Code" endpoint to resend the code should incase user didnt get the code at first

POST

Login

[Open Request](#)

{{baseUrl}}/account/login

User Login

This endpoint is used to login a registered user.

WHEN USER LOGIN DATA IS NOT CORRECT

See the sample response for with title 'Invalid login details'

WHEN USER ACCOUNT IS NOT VERIFIED

See the sample response with title 'Account not verified'

One thing you should note here is the token key value and the phone_number_verified_at key value (They both return null)

So when user account is not verified, take them to the page or screen where they can verify their account and call the resend verification code endpoint to send a code to their phone number

WHEN ALL CHECKS PASSES

The token key value and the phone_number_verified_at value (They both return data)

AuthorizationBearer Token
